

## Beyond 20/20 Vision...

A Thermographic Survey from Cannon Boiler Works, Inc. will give you a unique look at your operation that can't be seen by the naked eye.

Whether your process uses steam, hot water, or both, the first step toward energy savings is identifying energy losses. A *Thermographic Survey* from Cannon Boiler Works, Inc. can provide comprehensive results without downtime or physical intrusion to equipment or piping. Our high-tech imager will accurately map energy losses in areas where visual inspections are inadequate, and in a fraction of the time of any other invasive methods.

Energy savings and losses translate directly into profit gains and losses. With our service, we can show you how to recover some energy, as well as profits.

### ***A Thermographic Survey Will Identify:***

(Thermal Image of a Steam Trap)

- **Malfunctioning steam traps**
- **Insulation lapses / deterioration**
- **Improper valve function**
- **Hot spots on equipment (boilers, condensate and feed systems, tanks, etc.)**
- **Pump and motor function**
- **Hot spots in electrical panels**
- **Moisture intrusion**

Losing energy in the wrong places means wasting natural resources, possible equipment damage, negative environmental impact, higher operating costs, and decreased profits. Identifying and correcting these issues is a step toward becoming a clean and efficient operation.
